THE ULTIMATE GUIDE TO REVIT SHORTCUTS

ARCHSMARTER
helping architects and designers work smarter

For all the work you do in Revit, there's a keyboard shortcut that can help you do it faster.

Here's a roundup featuring some of my favorite Revit keyboard shortcuts to create and organize your model. Keep reading to learn how to create your own shortcuts.

Create and Modify Elements

CS	When element is selected, creates new similar element	**MV**	Move
DL	Create detail lines	**UP**	Unpin
DR	Create Door	**RM**	Create room
M + Space	Match properties	**RT**	Insert room tag
MV	Move	**SL**	Split elements

Select Elements

Arrow Keys	Nudges the selected element	**MD**	Activate the Modify tool
Shift + Arrow	Nudges the selected element 10x	**TAB**	Cycle through multiple overlapping elements
CTRL	Select multiple elements	**SHIFT + TAB**	Reverse the order of TAB cyclingv

Views

HI	Isolate element	**TL**	Thin Lines
HH	Hide element	**VV**	Visibility / Graphics dialog for the current view
HC	Hide category	**WF**	Wire frame
SD	Shaded with edges	**ZE**	Zoom to fit
SHIFT + Middle Mouse	Orbit in 3D views or pan in 2D views. Selecting an object before pressing SHIFT + Middle Mouse will cause the orbit to rotate around the selected object.		

File Operations

CTRL + O	Open a new file
CTRL + N	Create a new project file
CTRL + S	Save the current file

Miscellaneous

ALT	Activates the keyboard designation for all the items on the interface. Might be useful if your mouse kicks the bucket before you've saved your file.

THE ULTIMATE GUIDE TO REVIT SHORTCUTS

ARCHSMARTER
helping architects and designers work smarter

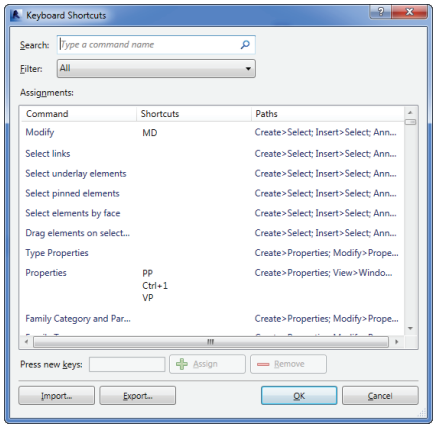

Create Your Own Revit Shortcuts

You can easily program your own Revit keyboard shortcuts. To do so, go to:

"View > User Interface > Keyboard Shortcuts
or type **'KS'"**

This will open the Keyboard Shortcuts dialog box.

All of the default keyboard shortcuts are listed. Any shortcut listed in gray is a system shortcut and cannot be changed. **To add a shortcut**, find the command in the "Command" column or enter the command name in the "Search" field. Once you've selected the command, enter the shortcut combination in the "Press new keys" text box then click the "Assign" button.

You have a lot of flexibility assigning shortcuts. A single command can have multiple shortcuts. Likewise, a single shortcut can be used on multiple commands. In this case, you use the arrow keys to cycle through the commands as displayed in the status bar. Once you have the command you want, press the space bar to execute the command.

Some custom shortcuts you might want to consider are:			
33	Default 3D View	**MM**	Macro Manager
AA	Activate view	**SAV**	Select all instances in view
DD	Deactivate view	**SAS**	Select all instances in project
JJ	Join geometry	**WS**	Worksets
ML	Manage Links	**WW**	Create walls

Naming Your Shortcuts

Speed is king when it comes to naming your shortcuts. Consider defining your shortcuts using the same letter or letters closely located on the keyboard. ***JJ*** for Join Geometry or ***AA*** for Activate View are two good examples.

You can even create three or four letter shortcuts if you need similarly named shortcuts. You could define ***WW*** for Create Wall and ***WWW*** for Worksets.

This method minimizes the amount of hunting and pecking required to find your shortcuts. It lets you keep one hand on the keyboard and the other on the mouse.
